RESEARCH ACTIVITIES

Marie Curie project „BATWOMAN“

ETI is a member of the Basic Acoustics Training- & Workprogram On Methodologies for Acoustics-Network is the Initial Training Network (ITN) No. 605867, funded under the FP7 (FP7-PEOPLE-2013-ITN) Marie Curie programme of the European Commission. Within two doctoral studies the interaction of musicians and rooms and the directivity of reverberation are investigated. The project will be funded until Aug. 31, 2017.

Sound radiation characteristics of musical instruments

We aim at measuring the change in radiation characteristics of musical instruments during playing. Time resolved sound radiation polar plots of a broad variety of instruments have been obtained from measurements with a ring-shaped microphone array.

Set-up for musical instrument directivity measurements in the horizontal plane and results (left/centre); set-up for measurement of input impedances of woodwind instruments (right)

Physical modelling of reed wind instruments

For the purpose of estimating sound and playing characteristics of a reed instrument from its geometry and material parameters, we are using a reduced physical model and experimental data obtained with an artificial mouth.

DFG-funded project “Technologies of singing“

Our work package within this joint project with the Musicology seminar aims at investigating the impact of early recording devices on the singing performance and voice quality of singers. „This project part has started in August 2016 and will be funded for 3 years.
